

NORTH AMERICAN PRODUCT TECHNICAL GUIDE

**Volume 3:
Modular Support Systems
Technical Guide,
Edition 1**

LET US BE YOUR DESIGN PARTNER

Hilti Engineering Services

HILTI TECHNICAL SERVICE

We are more than a supplier. We want to make your design process easier. That's why we offer a variety of technical support services to help architects and engineers evaluate and specify Hilti products. Experienced Hilti engineers and technical specialists will work with your team to assist with developing your unique structural or nonstructural application. We are committed to developing and maintaining the trust of our customers within the professional design and construction communities who recommend, specify, or use Hilti products.

Field Engineering and Fire Protection Specialists

- Product application design and detail assistance
- Specification consultation
- Design software support, e.g. Engineering Suite
- Continuing education seminars
- Installation and safety training
- Site specific product support

Field Engineering and Fire Protection Specialists

- Online download of LEED documents

Online Technical Services

www.hilti.com/engineering

Corporate Engineering

- Technical reports and approvals
- Online technical design center
- Technical software programs, e.g. Engineering Suite
- Product application consultation
- Firestop engineering judgments
- Project specific CAD support
- Decking submittal support
- Continuing education webinars
- Ask Hilti community

Corporate Testing Capabilities

- Concrete anchor and powder-actuated fastener test facility
- Full-scale Diaphragm Test Frame
- U.L. certified firestop assembly furnaces
- Independent witness by accredited organization

CONTENT OVERVIEW

MODULAR SUPPORT SELECTION GUIDE	6
1.0 INTRODUCTION	15
2.0 MODULAR SUPPORT TECHNOLOGY	16
3.0 MODULAR SUPPORT SYSTEM	21
4.0 ADDITIONAL HARDWARE	145
5.0 REFERENCE	148

Hilti North American Product Technical Guide Volumes 1 and 2 are also available.
Contact your Hilti Field Engineer about them today.

TABLE OF CONTENTS

MODULAR SUPPORT SELECTION GUIDE	6
1.0 INTRODUCTION	15
1.1 Published Load Values	15
1.2 General Information for Load Tables	15
1.3 Instructions For Use (IFU)	15
1.4 Units	15
1.5 Our Purpose	15
1.6 Our Quality System	15
2.0 MODULAR SUPPORT TECHNOLOGY	16
2.1 Benefits and Applications of MT	16
2.2 Evaluation of Technical Data	18
2.3 Information on Adjustability of MT Components	19
2.4 Corrosion	20
3.0 MODULAR SUPPORT SYSTEM	21
3.1 MT Profiles	21
MT Profile Material Specifications, Corrosion Protection, and Ordering Information	21
MT Angle and Channel Profile Dimensions	22
MT Girder Profile Dimensions	23
3.1.1 Cross-Section Properties of MT Profiles	24
3.1.2 MT Beam and Column Load Tables	29
Beam Design Fundamentals	29
Column Design Fundamentals	30
Beam Load, Shear, and Moment Diagrams	31
Load and Deflection Factors for Beams	32
Load Tables for Allowable Strength Design (ASD)	33
Load Tables for Limit State Design (LSD)	41
Beam Load Reduction Factors for Laterally Unbraced Channels	49
Beam Load Reduction Factors for Laterally Unbraced Girders	49
3.2 MT Components	50
3.2.1 MT Connection Mechanisms	
MT-TFB	50
MT-TL M10 + MT TLB	51
MT-TL 3/8" AND 1/2"	52
MT-CTAB	53
3.2.2 MT Base Connectors	
MT-B-L	54
MT-B-T	55
MT-B-O2	56
MT-B-O4	57
MT-B-O2B	58

3.0 MODULAR SUPPORT SYSTEM (CONTINUED)

3.2.2 MT Base Connectors (continued)

MT-B-GS T	59
MT-B-GS O4U	60
MT-B-GL O4	61
MT-B-GXL O4	62
MT-B-GXL S1	63
MT-B-GXL S2	64
MT-B-GXL S3	65
MT-B-G WS	66
MT-B-G AS	67
MT-B-GL O4C	68

3.2.3 MT System Connectors

MT-C-L1	69
MT-C-L2	70
MT-C-T/1	71
MT-C-LL1	72
MT-C-LL2	74
MT-C-T/2	75
MT-C-T A	77
MT-C-T 3D/2	78
MT-C-T 3D/3	79
MT-C-GS	81
MT-C-GL	83
MT-C-GS A	85
MT-C-GL A	86
MT-C-GSP L	87
MT-C-GSP T	88
MT-C-GLP T	89
MT-C-GLP X A	90
MT-C-GLP T A	91
MT-C-GSP T A	92
MT-C-GSP L A	93
MT-C-LDP L1	94
MT-C-T 3D/2/HL	95

3.2.4 MT Splice Connectors

MT-ES-40	96
MT-ES-60	97
MT-ES-70	98
MT-ES-90	99

3.2.5 MT Beam Connectors

MT-U-GL 1	100
-----------	-----

3.2.6 MT Angle Braces and Fittings

MT-AB-A	101
MT-AB-L 45	102
MT-AB-LL2 45	103
MT-AB-G T	104
MT-B-GS AB	105
MT-B-GL AB	106

3.0 MODULAR SUPPORT SYSTEM (CONTINUED)

3.2.7 MT Brackets

MT-BR-30	107
MT-BR-40	107
MT-BR-40D	107
MT-BR-40 O4	107
MT-BR-40D O4	107

3.2.8 MT Clamps and Channel Ties

MT-CC-30	111
MT-CC-40/50	112
MT-CC-40D	113
MT-CC-70	114
MT-CT-H2	115
MT-CT-H5	116
MT-CT-T	117
MT-CT-H4	118

3.2.9 MT Beam Clamps

MT-BC-GS T	119
MT-BC-GXL T	120
MQT-21-41	121
MQT-41-82	122
MQT-U	123

3.2.10 MT Threaded Rod Connectors and Pipe Saddles

MT-CTR-GS	124
MT-CTR-GL	125
MT-C-PS	126
MI-PSCU / MI-PSU	127

3.2.11 MT Media Fixation

MT-FA-G	129
MT-FPS-GS	131
MT-FPS-GL	132
MT-SP	133
MP-UB	134
MP-US	136

3.2.12 MT Load Distribution Plates

MT-B-LDP S	138
MT-B-LDP ME	139

3.2.13 MT Modular Plates

MT-P-G S1 / MT-P-GM S1	140
MT-P-G S2 / MT-P-GM S2	141
MT-P-G S3 / MT-P-GM S3	142

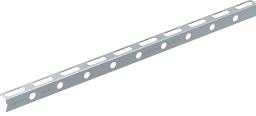

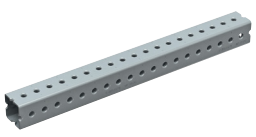

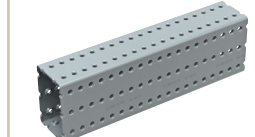

3.2.14 MT Accessories and End Caps

MT-EC-20/30/40/50/60	143
MT-EC-70/80/90/100	144

4.0 ADDITIONAL HARDWARE	145
Threaded Rod	145
Hex Nuts	146
Washers	146
Rod Couplers	147
Hex Bolts	147
5.0 REFERENCE	148

1.0 INTRODUCTION

1.1 PUBLISHED LOAD VALUES

Technical data herein is current as of the date of publication. Load values are based on testing, finite element analysis, and analytical calculations. Information on how technical data is evaluated for the purposes of this Technical Guide is provided in Section 2.2. When using the published load values in this Technical Guide, the specific application must always be checked for feasibility by the Design Professional.

Requests for additional information on Hilti Modular Support Systems beyond the scope of this Technical Guide may be submitted to Hilti Technical Services.

For information regarding updates and changes, please contact Hilti, Inc. (US) Technical Support at **1-877-749-6337** or Hilti (Canada) Corporation at **1-800-363-4458**.

1.2 APPROVALS/LISTINGS

Many Hilti Modular Support System products have listings or approvals such as International Code Council Evaluation Services Reports (ICC-ES ESR's). Listings and approvals are provided by independent third parties who evaluate products based on model building codes or various jurisdictional requirements. Product listings and approvals indicate that a product has been tested and evaluated based on a specific acceptance or test criteria.

Not all technical data contained in this document is based on a published approval or listing. Hilti may publish additional data beyond that contained in a report, e.g. for applications outside the scope of an available test criteria.

Approvals and listings have been indicated in the Modular Support Systems Technical Guide for reference. Acceptance of the product listings or approvals is subject to the Authority Having Jurisdiction over the project.

It is important for the Design professional to determine if the application or conditions expected for the project are included in the scope of the approval or listing.

1.3 INSTRUCTIONS FOR USE (IFU)

Tabulated technical data for all profiles and connectors in this Technical Guide is based on following the Instructions For Use (IFU), packaged with each product, for special installation parameters and additional hardware required.

1.4 UNITS

Technical data is provided in both Imperial and Metric units. Metric values provided herein use the International System of units (SI) in observance of the Metric Conversion Act of 1975 as amended by the Omnibus Trade and Competitiveness Act of 1988. MT connector dimensions are provided in both SI units and Imperial units.

1.5 OUR PURPOSE

We make construction better!

Customer Promise

We strive to be your best partner for productivity, safety, and sustainability.

Productivity

In how our customers perform their work and run their business.

Safety

For our customers and for the end user of the building.

Sustainability

At Hilti and for our customers.

1.6 OUR QUALITY SYSTEM

Hilti is one of a select group of North American companies to receive the ISO 9001 and ISO 14001 Certifications. This recognition of our commitment to quality assures our customers that Hilti has the systems and procedures in place to maintain our position as the world market leader and to continually evaluate and improve our performance.

2.0 MODULAR SUPPORT TECHNOLOGY

2.1 BENEFITS AND APPLICATIONS OF MT

One Integrated System

Hilti's MT system is your solution to nearly all of your modular support structures, covering applications ranging from cable trays, piping supports, overhead grids, and multi-trade racks.

The MT portfolio allows components to be bolted together quickly and efficiently to provide support for your applications. Because welding is not required, installation work can be done in flame and gas sensitive areas. Whether your application needs are simple or complex, the MT system has you covered.

The Hilti MT Support System helps reduce planning and installation time. Because each piece is lightweight and generally reconfigurable, there is no need for heavy equipment. As such, the system helps reduce waste, adding to the overall system efficiency and savings to your bottom line.

The MT portfolio is designed to be complementary to the full range of MT open (angles and channels) and closed (girders) profiles.

Flexible

- Easier to install, reconfigure, and extend.
- More efficient design to satisfy "as built" tolerances.
- One integrated portfolio to cover light-duty to heavy-duty support configurations.

Efficient

- Faster and more consistent installation with the SIW-AT module.
- Faster and easier on-site installation requires no specialized labor.
- No welding means less downtime and hot work permit for constructing supports.

Economical

- All parts are re-adjustable in the field.
- One MT connector can have multiple applications, saving component and installation cost.
- Up to 50% lighter than equivalent welded systems, less special lifting equipment required.
- No welding with a Hilti Modular System means avoiding potentially high welding costs.

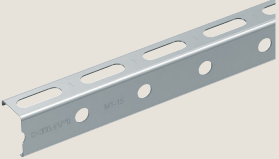

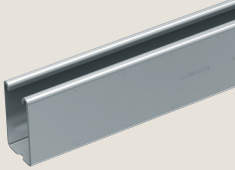

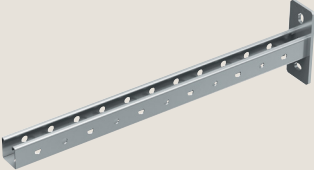

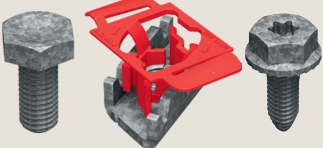

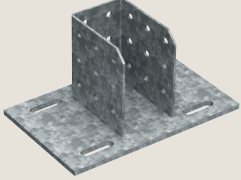

Safe

- Connection mechanism with reinforced dome holes on MT girders.
- Cutting-edge corrosion resistance with the use of Zinc Magnesium Coating.

2.0 MODULAR SUPPORT TECHNOLOGY

2.1 BENEFITS AND APPLICATIONS OF MT (CONTINUED)

Angle Profiles	Open Channel Profiles	Closed Girder Profiles	Brackets
 <p>MT angles (MT-10 and MT-15) are ultra-light profiles that are used primarily for light-duty trapeze applications. In such applications, MT angles are installed in a horizontal orientation and supported vertically by threaded rods with nuts. Note: MT connectors are not intended for use with angle profiles.</p>	 <p>Open channels (MT-20, MT-30, MT-50, and MT-60) may be used for a wide range of light-duty to medium-duty applications. Channels can be used as beams or columns. While these members can resist bending, shear, and compression, they are not recommended for use with torsional loading. MT open channels have full 2D and 3D connectivity capabilities with MT connectors.</p>	 <p>Closed MT profiles (MT-70, MT-80, MT-90, and MT-100), or "girders", are used for heavy-duty applications. The closed shape of these profiles results in a greater cross-sectional area compared to similarly sized channels and, accordingly, yields significantly higher capacities in bending, shear, compression, and torsion. Reinforced holes along each girder face provide greater contact area for thread forming with the MT Thread Forming Bolt (MT-TFB) connection mechanism.</p>	 <p>MT brackets of various sizes and lengths act as cantilevered beams. With 2-hole and 4-hole base plate options, MT brackets can anchor to concrete, attach to MT channels and girders, or directly fasten to steel.</p>
Connection Mechanisms	Base/Girder Connectors	Steel Connectors	Concrete Connectors
 <p>The twist-lock mechanism (MT-TL with MT-TLB) may be installed anywhere along the open face of MT channels. Once installed, a high shear capacity is then made possible by the innovative twist-lock (MT-TL) and its "On-The-Spot" serration. Hilti MT-TFB Thread Forming Bolts securely connect to closed profiles (girders) without the need for nuts or additional washers, as the washer is integrated within the head of the MT-TFB. During installation, a robust thread is formed within the reinforced girder hole, minimizing the risk of thread stripping.</p>	 <p>Many of the connectors in the MT portfolio may be used as either base connectors or as system connectors (to MT channels or girders via MT-TFB). Using bolt holes in the MT channels and girders that interlock with the clouded and slotted holes in the connectors, MT systems are adjustable up to 1" on the first installation, and can be fine adjusted by 3/16".</p>	 <p>Connections to steel are made using robust beam clamps and innovative direct fastening technology (X-BT/S-BT/F-BT). The base plates are designed to cover a large range of standard steel profiles with flange widths up to 12". Girder clamping accommodates steel profiles with flange widths greater than 12".</p>	 <p>MT connector base plates can be anchored to concrete using a variety of Hilti anchors. Choose from mechanical and chemical anchors according to loading and base material conditions.</p>
Channel Connectors			
 <p>MT channel connectors, when used in combination with the twist-lock mechanism, act as system connectors between channel profiles. Many of these connectors can be installed in a variety of configurations.</p>			

2.0 MODULAR SUPPORT TECHNOLOGY

2.2 EVALUATIONS OF TECHNICAL DATA

All technical data provided in this Technical Guide is based on analytical calculations, finite element analysis, or testing by Hilti or by contracted testing laboratories using testing procedures and construction materials representative of current practice in North America. Published loads are provided for independent loading directions. The design professional shall consider appropriate interaction equations when loading is applied in multiple directions.

Analytical Calculations

Analytical calculations based on the provisions of AISI S100-16 (for USA) and CSA S136-16 (for Canada) are permitted for determining the load capacities of cold-formed steel members.

Finite Element Analysis

In accordance with AISI S100-16/CSA S136-16, rational engineering analysis based on appropriate theory and engineering judgment is permitted as an alternative to testing and analytical methods for obtaining design load data. Accordingly, finite element analyses were performed to derive the technical data for several connector components contained herein.

Testing

In accordance with AISI S100-16/CSA S136-16 Chapter K, data based solely on tests represents the average results of at least three identical specimens, provided that no individual test result deviates from the average value of all tests by more than 15 percent. Once an average value of all acceptable tests made is determined, a nominal strength, R_n , for the series of tests is obtained. The coefficient of variation, V_p , of the test results is then determined by statistical analysis.

Data based on rational engineering analysis with confirmatory tests is based on a minimum of three tests. A correlation coefficient, C_c , based on the tested strength, R_t , is compared to the nominal strength, R_n , predicted from rational engineering analysis models. The correlation between C_c and R_t , must be greater than or equal to 0.80.

For allowable strength design (ASD), the allowable strength value, R_a , is then computed as follows:

$$R_a = \frac{R_n}{\Omega}$$

The safety factor, Ω , is derived from the following equation:

$$\Omega = \frac{1.6}{\phi}$$

Where the resistance factor, Φ :

$$\phi = C_\phi (M_m F_m P_m) e^{-\beta_o \sqrt{V_M^2 + V_F^2 + C_p V_P^2 + V_Q^2}}$$

And:

- C_ϕ = Calibration coefficient
- M_m = Mean value of material factor
- F_m = Mean value of fabrication factor
- P_m = Mean value of professional factor
- e = Natural logarithmic base
- β_o = Target reliability index
- V_M = Coefficient of variation of material factor
- V_F = Coefficient of variation of fabrication factor
- C_p = Correction factor
- V_P = Coefficient of variation of test results
- V_Q = Coefficient of variation of load effect

The correlation coefficient, C_c :

$$C_c = \frac{n \sum R_{t,i} R_{n,i} - (\sum R_{t,i}) (\sum R_{n,i})}{\sqrt{n(\sum R_{t,i}^2) - (\sum R_{t,i})^2} \sqrt{n(\sum R_{n,i}^2) - (\sum R_{n,i})^2}}$$

Where:

- n = Number of tests
- $R_{t,i}$ = Tested strength (resistance) of test i
- $R_{n,i}$ = Calculated nominal strength (resistance) of test i per rational engineering analysis model

2.0 MODULAR SUPPORT TECHNOLOGY

2.3 INFORMATION ON ADJUSTABILITY OF MT COMPONENTS

The MT System, as with all Hilti modular installation systems, is designed for a single permanent installation. A single permanent installation is achieved with the following: the assembly process is complete, the system is subjected to the final in-use conditions, and the expected design loads are applied to the structure. It may remain in this use for as long as the expected lifespan, with due adherence to project-specific inspection and maintenance requirements. It is not designed to be completely disassembled and then rebuilt or re-purposed, as the use conditions of the original structure may have changed over time (e.g. applied loads, impact, corrosion attack, product modifications etc.). Any reuse of the MT System beyond a single permanent installation is at the risk of the customer.

Twist-Lock (MT-TL) Connection Mechanism

The Twist-Lock interface is designed for a single permanent installation. However, during assembly, the Twist-Lock may be repositioned as necessary until final installation is completed. Final installation is achieved when the Twist-Lock installation torque in the Instructions For Use (IFU) is reached.

Repositioning the Twist-Lock can occur at any point along the MT channel length. Once the installation torque as defined in the IFU has been applied to the Twist-Lock, its location can no longer be adjusted. A new Twist-Lock must be utilized for final installation in a new location.

Thread Forming Bolt (MT-TFB) Connection Mechanism

The MT-TFB forms a thread into the reinforced hole of the MT girder during assembly. After assembly, the MT-TFB may be subsequently removed to enable positional adjustments of connectors. Once this thread has been formed, so long as the thread remains intact (e.g. it is not cross threaded), the threaded hole can be used up to four additional times (five in total). A torque-controlled wrench is recommended when reusing a reinforced MT girder hole. Reuse of the MT-TFB is possible but should be limited to five re-uses. Any reuse beyond this limit could lead to degradation of the tip of the bolt, thereby negatively impacting its performance.

If a customer is uncertain how many times a reinforced hole in an MT girder has been used, then a fresh hole should be used for installation. Likewise, a new MT-TFB should be used if it is unknown the number of times it has been used previously.

The upper limit of five uses for a single MT-TFB for MT girder connections may be extended if the Hilti Adaptive Torque Module (SI-AT-A22, in combination with the Hilti impact wrench SIW 6AT-A22) is used with the correct MT-TFB parameter set (found via the QR code on the box of the MT-TFB's). An important feature of the Adaptive Torque Module is that it will indicate if the connection mechanism has been correctly set. If it determines the connection mechanism has been correctly set, a green light will illuminate, indicating the correct amount of pre-tensioning has been achieved. If a red light illuminates, then the connection mechanism is not sufficient and should not be used. Refer to the product documentation for the Adaptive Torque Module for additional guidance.

2.0 MODULAR SUPPORT TECHNOLOGY

2.4 CORROSION

The following is an overview of typical finishes used on Hilti MT products. For more detailed information from Hilti on material finishes and corrosion protection, please consult the Hilti Corrosion Handbook which can be found under the Documents section for MT portfolio items on Hilti Online.

Electro-Galvanized (EG)

Electro-Galvanized, or zinc plated, bonds a minimum 0.5 mil zinc coating to carbon steel through an electrolysis process. Most Hilti MT connectors and miscellaneous hardware are available with an electro-galvanized finish. This coating is in accordance with DIN EN ISO 2081.

Pre-Galvanized (PG)

Pre-Galvanized parts are manufactured by passing sheet steel through a molten zinc bath. Afterwards, the sheets are cold-formed into applicable shaped profiles and slots are punched, hence the name “pre-galvanized”. PG refers to pre-galvanized parts with punches slots and PGS refers to solid strut. Surfaces of the punched and cut portions are partially protected by the adjacent zinc plating which acts as a sacrificial anode impeding corrosion of the raw edges. However, if corrosion remains a concern additional protection may be required. PG conforms to ISO EN 10346 galvanizing, with a Z275 thickness (0.787 mils thick or 0.77 ounces zinc per square foot of steel).

Outdoor Coating (OC)

The Hilti MT OC System for outdoor applications has been developed with various corrosion protection technologies and consists of two finishes: Hot-Dipped Galvanized (HDG) and Zinc Magnesium (ZM). The Hilti OC is intended primarily for use in environments considered Outdoor with low pollution. For more corrosive environments, additional protection may be required. The proper amount of corrosion protection for a given application should always be assessed by the Design professional to ensure products meet the project requirements.

Hot Dipped Galvanized (HDG)

Component parts such as base plates and system connectors have zinc coatings applied by the hot-dipped galvanizing (HDG) process in accordance with the ASTM A153M Standard. On hot dipped galvanized parts, the zinc coating process occurs after cold forming and punching. The parts are pretreated, pickled, and then dipped into tanks of molten zinc. HDG provides increased corrosion resistance compared to PG and EG finishes. HDG conforms to ASTM A153/A153M galvanizing as stated on the product sheet for beams, connectors, bases, splices, and fasteners. Suitability of a HDG finish for a product must be assessed for each project.

Zinc Magnesium (ZM)

MT profiles such as strut, channels, and girders are coated with zinc-aluminum-magnesium alloy (ZM) by a continuous hot-dip galvanizing process during the steel coil phase in accordance with the EN 10346 Standard. On Zinc Magnesium parts, the process involves sheet metal coils that are drawn continuously through a bath of molten zinc after the surface has been cleaned and it is subjected to a special annealing process. In addition to zinc, the molten bath contains Magnesium (Mg) and Aluminum (Al). The Aluminum reacts with the steel surface to create a layer with a thickness of 0.984 mils per side (1.02 ounces per square foot), which inhibits the formation of ZnFe phases. Hilti’s OC ZM processing conforms to the EN 10346 Galvanizing Standard.

1. Tabulated values are in accordance with ICC-ES ELC-5019 and CSA S136-16, the North American Specification for the Design of Cold-Formed Steel Structural Members (using the Appendix B provisions applicable to Canada), CSA Group.

2. Tabulated gross properties, including torsional properties, are based on the full unreduced cross section of the profiles, away from the punched holes and slots.

3. For deflection calculations, use the effective moment of inertia.

4. C.G. is the center of gravity of the profile cross-section.

3.0 MODULAR SUPPORT SYSTEM

3.1.2 MT BEAM AND COLUMN LOAD TABLES

Beam Design Fundamentals

Hilti modular support system profiles may be used in a wide variety of beam applications. Beams are structural elements that resist applied loads perpendicular to their length.

Beams must be designed for shear, flexure (bending), torsion, and deflection. In some cases, beams may be subjected to an axial load that acts concurrently with the applied perpendicular loads, and the member must be accordingly designed for the combined effects of bending and compression. Examples of typical load, shear, and moment diagrams for beams are shown on page 31. Per AISI S100-16/CSA S136-16, cold-formed steel beams, which typically consist of highly customized profiles with very slender elements, must be designed for the effects of local buckling, distortional buckling, and for yielding and global buckling. Additionally, local buckling interacting with yielding and global buckling must be checked. The load values given in the beam tables in this technical guide represent the controlling load capacities for beams that are sufficiently laterally braced with due consideration of these limit states. A fully braced beam is restrained against twisting about the beam's longitudinal axis as well as lateral movement perpendicular to the beam's longitudinal axis. For unbraced conditions, reductions must be applied to the allowable loads per page 49.

Beam Loading

Beam load tables in this technical guide are based on a "uniformly loaded" condition unless noted otherwise. Uniform loads are distributed evenly along the length of the member.

See page 32 for modification factors to be applied to allowable load values for non-uniform loading conditions.

Support Conditions

A "simply-supported" beam is a single-span beam, supported at its ends, whose supports restrain translation (lateral movement) in the 3 orthogonal directions as well as twisting about the beam's longitudinal axis, but do not restrain bending moments.

A "fixed-end" beam is a single-span beam, supported at its ends, whose supports restrain translation and rotation (bending and twisting moments) in the 3 orthogonal directions. Several Hilti MT connectors allow for moment resistance which can be used to simulate a "fixed-end" beam.

A "cantilevered" beam is a single-span beam, supported at only one end and free to translate and rotate at its other (unsupported) end. The supported end of a "cantilevered" beam is considered a "fixed-end". MT brackets are examples of "cantilevered" beams.

Note that beam load tables in this technical guide are based on a "simply-supported" beam span condition unless noted otherwise. See page 32 for modification factors to be applied to allowable load values for non-simply-supported span conditions.

Deflection

Beam designs can often be governed by deflection limits (serviceability). Beam deflections are computed based on the magnitude and type of applied loading, the member's length, L , elastic modulus, E , moment of inertia about the axis under consideration, I , and support conditions.

Allowable loads corresponding to deflection limits in this technical guide are based on "simply-supported" and "uniformly loaded" conditions. See page 32 for modification factors to be applied to allowable load values for other conditions.

3.0 MODULAR SUPPORT SYSTEM

3.1.2 MT BEAM AND COLUMN LOAD TABLES

Column Design Fundamentals

Columns are structural elements that resist applied loads primarily in axial compression along their length.

A column's capacity is based on its unbraced length (noted as "height" in load tables), support conditions, cross-sectional properties, material properties, and load location (i.e. whether applied at the column's center of gravity or at the face of the profile).

Column Unbraced Length

The unbraced length of a column represents the distance between braced locations. Braced locations along a column are restrained against lateral movement (perpendicular to the length of the column). The larger the unbraced height of a column, its ability to resist applied loads is decreased. The tendency for a column to buckle about an axis under consideration is highly dependent on its slenderness ratio, KL/r , where K is the effective length factor (explained to the right), L is the unbraced length of the column, and r is the radius of gyration for the cross section. The AISI S100-16/CSA S136-16 Specification recommends that such ratios not exceed 200 for compression members. Buckling must be considered in both principal directions for a column, with the smaller buckling load controlling the design. Remember that for members that are not doubly symmetric (e.g channels), the radius of gyration will be different for each principal direction.

Column Loading - Concentric

A load applied at the center of gravity, C.G., of a column cross section is considered concentric. Such a load does not induce a bending moment in the column at the point of load application.

Column Loading - Eccentric

A load applied away from the center of gravity, C.G., of a column cross section is considered eccentric (e.g. a load at the slotted face of an MT channel). Such a load induces a bending moment in the column at the point of load application and, consequently, results in a lower allowable column load compared to a concentrically loaded condition. Columns with higher slenderness ratios are particularly sensitive to eccentrically applied axial loads.

Column Support Conditions

A column's allowable load capacity depends considerably on its support (end) conditions. Variations in support conditions for a column are addressed via an Effective Length Factor, K , which modifies a non-pinned-end column's unbraced height to represent that of an equivalent pinned-end column. Accordingly, the K value for a pinned-end column is 1.0. See the figure below for applicable K values to be used for certain column support conditions.

--	---	--	--	--	---

W: Uniformly Distributed Load
L: Beam Span Length
 R_L : Reaction at Left End
 R_R : Reaction at Right End

V: Shear
 V_{max} : Maximum Shear
M: Moment
 M_{max} : Maximum Moment

P: Concentrated (Point) Load
E: Modulus of Elasticity
I: Moment of Inertia
 Δ_{max} : Maximum Deflection of Beam

3.0 MODULAR SUPPORT SYSTEM

3.1.2 MT BEAM AND COLUMN LOAD TABLES

Table 12 - Load and Deflection Factors for Beams

Span and Loading Condition		Load Factor	Deflection Factor
Simple Beam - Uniform Load		1.00	1.00
Simple Beam - Concentrated Load at Mid-span		0.50	0.80
Simple Beam - Two Equal Concentrated Loads at 1/4 Points		1.00	1.10
Beam Fixed at Both Ends - Uniform Load		1.50	0.30
Beam Fixed at Both Ends - Concentrated Load at Mid-span		1.00	0.40
Cantilever Beam - Uniform Load		0.25	2.40
Cantilever Beam - Concentrated Load at End		0.12	3.20
Continuous Beam - Two Equal Spans, Uniform Load on One Span		1.3	0.92
Continuous Beam - Two Equal Spans, Uniform Load on Both Spans		1.00	0.42
Continuous Beam - Two Equal Spans, Concentrated Load at Center of One Span		0.62	0.71
Continuous Beam - Two Equal Spans, Concentrated Load at Center of Both Spans		0.67	0.48

The allowable beam load tables in this technical guide are for single-span supported beams with uniform loading. Common arrangements of other load and support conditions are shown in the above table. Loads and deflections for these conditions can be determined by multiplying the load value from the tables by the given load and deflection factors. Additional reduction factors for unbraced beam lengths may apply per the tables on page 49.

EXAMPLE 1)

Determine the maximum allowable load and deflection for an MT-50 fully braced cantilever beam with a concentrated load at the unsupported end.

SOLUTION:

- Allowable load and deflection for an MT-50 with a 48" span from Table 19 on Page 35 is 1,000 lbs and 0.24".
- Multiply by factors from above table:
 Load = (1,000 lbs - 1.97 x 4) x 0.12 = 119 lbs
 Deflection = 0.24" x 3.20 = 0.77"

EXAMPLE 2)

Determine the maximum allowable load and deflection for a two-span MT-70 fully braced continuous beam that is uniformly loaded on one span.

SOLUTION:

- Allowable load and deflection for an MT-70 with a 48" span from Table 25 on Page 37 is 2,520 lbs and 0.28".
- Multiply by factors from above table:
 Load = (2,520 lbs - 2.64 x 4) x 1.3 = 3,260 lbs
 Deflection = 0.28" x 0.92 = 0.26"

Notes:

1. Loads are based on ICC-ES ESR-5019 and AISI S100-16, the North American Specification for the Design of Cold-Formed Steel Structural Members.
2. Safety factors for flexure and compression are 1.67 and 1.80, respectively.
3. Allowable beam loads in table are given in total uniform load ($W \cdot \text{Span}$) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 0.84 lbs/ft (12.26 N/m), must be deducted from allowable beam load values.
6. Multiply tabulated load values by 1.5 to obtain Load and Resistance Factor Design (LRFD) values.
7. C.G. is the 'Center of Gravity' of the cross section.
8. ** indicates KL/r for compression exceeds 200.
9. Maximum allowable load at channel face assumes K value of 0.8.

144 (365.8)	**	**	**	**	**

Notes:

1. Loads are based on ICC-ES ESR-5019 and AISI S100-16, the North American Specification for the Design of Cold-Formed Steel Structural Members.
2. Safety factors for flexure and compression are 1.67 and 1.80, respectively.
3. Allowable beam loads in table are given in total uniform load ($W * \text{Span}$) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 1.1 lbs/ft (16.09 N/m), must be deducted from allowable beam load values.
6. Multiply tabulated load values by 1.5 to obtain Load and Resistance Factor Design (LRFD) values.
7. C.G. is the 'Center of Gravity' of the cross section.
8. ** indicates KL/r for compression exceeds 200.
9. Maximum allowable load at channel face assumes K value of 0.8.

144 (365.8)	1,000 (4,445)	2,025 (9,005)	1,560 (6,935)	**	**

Notes:

1. Loads are based on ICC-ES ESR-5019 and AISI S100-16, the North American Specification for the Design of Cold-Formed Steel Structural Members.
2. Safety factors for flexure and compression are 1.67 and 1.80, respectively.
3. Allowable beam loads in table are given in total uniform load (W * Span) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 1.97 lbs/ft (28.74 N/m), must be deducted from allowable beam load values.
6. Multiply tabulated load values by 1.5 to obtain Load and Resistance Factor Design (LRFD) values.
7. C.G. is the 'Center of Gravity' of the cross section.
8. ** indicates KL/r for compression exceeds 200.
9. Maximum allowable load at channel face assumes K value of 0.8.

Notes:

1. Loads are based on ICC-ES ESR-5019 and AISI S100-16, the North American Specification for the Design of Cold-Formed Steel Structural Members.
2. Safety factors for flexure and compression are 1.67 and 1.80, respectively.
3. Allowable beam loads in table are given in total uniform load ($W * \text{Span}$) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 2.63 lbs/ft (38.39 N/m) must be deducted from allowable beam load values.
6. Multiply tabulated load values by 1.5 to obtain Load and Resistance Factor Design (LRFD) values.
7. C.G. is the 'Center of Gravity' of the cross section.
8. ** indicates KL/r for compression exceeds 200.
9. Maximum allowable load at girder face assumes K value of 0.8.

1. Loads are based on ICC-ES ESR-5019 and AISI S100-16, the North American Specification for the Design of Cold-Formed Steel Structural Members.
2. Safety factors for flexure and compression are 1.67 and 1.80, respectively.
3. Allowable beam loads in table are given in total uniform load (W * Span) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 6.01 lbs/ft (87.74 N/m), must be deducted from allowable beam load values.
6. Multiply tabulated load values by 1.5 to obtain Load and Resistance Factor Design (LRFD) values.
7. C.G. is the 'Center of Gravity' of the cross section.
8. ** indicates KL/r for compression exceeds 200.
9. Maximum allowable load at girder face assumes K value of 0.8.

Notes:

1. Loads are based on ICC-ES ESR-5019 and AISI S100-16, the North American Specification for the Design of Cold-Formed Steel Structural Members.
2. Safety factors for flexure and compression are 1.67 and 1.80, respectively.
3. Allowable beam loads in table are given in total uniform load (W * Span) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 10.0 lbs/ft (145.99 N/m), must be deducted from allowable beam load values.
6. Multiply tabulated load values by 1.5 to obtain Load and Resistance Factor Design (LRFD) values.
7. C.G. is the 'Center of Gravity' of the cross section.
8. ** indicates KL/r for compression exceeds 200.
9. Maximum allowable load at girder face assumes K value of 0.8.

Notes:

1. Loads are based on ICC-ES ELC-5019 and CSA S136-16, the North American Specification for the Design of Cold-Formed Steel Structural Members (using the Appendix B provisions applicable to Canada), CSA Group.
2. Resistance factors for flexure and compression are 0.90 and 0.80, respectively.
3. Maximum factored beam loads in table are given in total uniform load (W * Span) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 0.84 lbs/ft (12.26 N/m), must be deducted from maximum factored beam load values.
6. C.G. is the 'Center of Gravity' of the cross section.
7. ** indicates KL/r for compression exceeds 200.
8. Maximum factored load at channel face assumes K value of 0.8.

84 (213.4)	**	2,210 (9,825)	**	**	**
96 (243.8)	**	1,690 (7,520)	**	**	**
108 (274.3)	**	**	**	**	**
120 (304.8)	**	**	**	**	**
144 (365.8)	**	**	**	**	**

Notes:

1. Loads are based on ICC-ES ELC-5019 and CSA S136-16, the North American Specification for the Design of Cold-Formed Steel Structural Members (using the Appendix B provisions applicable to Canada), CSA Group.
2. Resistance factors for flexure and compression are 0.90 and 0.80, respectively.
3. Maximum factored beam loads in table are given in total uniform load (W * Span) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 1.1 lbs/ft (16.09 N/m), must be deducted from maximum factored beam load values.
6. C.G. is the 'Center of Gravity' of the cross section.
7. ** indicates KL/r for compression exceeds 200.
8. Maximum factored load at channel face assumes K value of 0.8.

Notes:

1. Loads are based on ICC-ES ELC-5019 and CSA S136-16, the North American Specification for the Design of Cold-Formed Steel Structural Members (using the Appendix B provisions applicable to Canada), CSA Group.
2. Resistance factors for flexure and compression are 0.90 and 0.80, respectively.
3. Maximum factored beam loads in table are given in total uniform load ($W \times \text{Span}$) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 2.63 lbs/ft (38.39 N/m), must be deducted from maximum factored beam load values.
6. C.G. is the 'Center of Gravity' of the cross section.
7. ** indicates KL/r for compression exceeds 200.
8. Maximum factored load at girder face assumes K value of 0.8.

240 (609.6)	20,995 (93,385)	56,160 (249,805)	38,375 (170,700)	24,555 (109,240)	17,055 (75,870)

Notes:

1. Loads are based on ICC-ES ELC-5019 and CSA S136-16, the North American Specification for the Design of Cold-Formed Steel Structural Members (using the Appendix B provisions applicable to Canada), CSA Group.
2. Resistance factors for flexure and compression are 0.90 and 0.80, respectively.
3. Maximum factored beam loads in table are given in total uniform load (W * Span) and based on a uniformly loaded condition with simply supported ends. For other loading and support conditions, see page 32 for applicable load and deflection modification factors.
4. Beams spans in table are assumed to be sufficiently laterally braced. Unbraced spans may reduce beam load carrying capacity. See page 49 for reduction factors for unbraced conditions.
5. Profile weight, 10.0 lbs/ft (145.99 N/m), must be deducted from maximum factored beam load values.
6. C.G. is the 'Center of Gravity' of the cross section.
7. ** indicates KL/r for compression exceeds 200.
8. Maximum factored load at girder face assumes K value of 0.8.

144 (365.8)	-	-	0.69	0.29	0.49	0.60	0.31	0.86
168 (426.7)	-	-	0.65	0.25	0.44	0.53	0.28	0.79
192 (487.7)	-	-	0.61	0.22	0.41	0.46	0.26	0.73
216 (548.6)	-	-	0.58	0.19	0.38	0.41	0.24	0.68
240 (609.6)	-	-	0.54	0.17	0.35	0.36	0.23	0.62

1. Linear interpolation is not permitted.
2. Reduction factors in table are based on loading through the shear center of the cross section. The impact of torsion is not accounted for in these values.
3. Reduction factors are to be applied to the tabulated beam load values for fully braced spans. Additional modification factors based on loading and support conditions may apply per Table 12 on page 32.
4. Tabulated values conservatively assume a value for the lateral torsional-buckling modification factor, C_b , of 1.0.

Table 58 - MT Beam Load Reduction Factors for Laterally Unbraced Girders^{1,2}

Span in (cm)	MT-70	MT-80	MT-90	MT-100
	x- and y-axis	x- and y-axis	x- and y-axis	x- and y-axis

2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. Tabulated values require that minimum grade 8.8 threaded rods must be used.
4. Tabulated values are for assembly shown in Figure 18. Design Professional is responsible for checking strength of supporting steel member.
5. Tabulated values are based on friction that is provided mechanically and not due to gravity loads.

Table 94 - Limit State Design (LSD) Load Data^{1,2,3,4}

F _x lb (kN)	F _y ⁴ lb (kN)	F _z ⁴ lb (kN)	M _y lb ft (kN m)	M _z lb ft (kN m)
25,170 (112.0)	5,035 (22.4)	5,035 (22.4)	6,290 (8.53)	3,670 (4.98)

1. Maximum resistance factor, Φ , for tabulated values is 0.7.
2. Tabulated values require that minimum grade 8.8 threaded rods must be used.
3. Tabulated values are for assembly shown in Figure 18. Design Professional is responsible for checking strength of supporting steel member.
4. Tabulated values are based on friction that is provided mechanically and not due to gravity loads.

Figure 19 - MT Girder Clamped to Steel

A. MT-90/100

Table 95 - Allowable Strength Design (ASD) Load Data^{1,2,3,4}

F _x lb (kN)	F _y ⁴ lb (kN)	F _z ⁴ lb (kN)	M _y lb ft (kN m)	M _z lb ft (kN m)
14,380 (64.0)	1,545 (6.88)	1,545 (6.88)	4,835 (6.56)	2,100 (2.85)

1. Minimum safety factor, Ω , for tabulated values is 2.3.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. Tabulated values are for assembly shown in Figure 19. Design Professional is responsible for checking strength of supporting steel member.
4. Tabulated values are based on friction that is provided mechanically and not due to gravity loads.

Table 96 - Limit State Design (LSD) Load Data^{1,2,3}

F _x lb (kN)	F _y ³ lb (kN)	F _z ³ lb (kN)	M _y lb ft (kN m)	M _z lb ft (kN m)
21,580 (96.0)	2,315 (10.3)	2,315 (10.3)	6,290 (8.53)	3,145 (4.27)

1. Maximum resistance factor, Φ , for tabulated values is 0.6.
2. Tabulated values are for assembly shown in Figure 19. Design Professional is responsible for checking strength of supporting steel member.
3. Tabulated values are based on friction that is provided mechanically and not due to gravity loads.

3.0 MODULAR SUPPORT SYSTEM

3.2.2 MT BASE CONNECTORS

MT-B-GXL S2 OC

Description

Base plate for fixation of MT-90 and MT-100 girder structures to 5.9"-9.7" steel flange widths.

Material Specifications

Standard ¹	Grade ¹	F _y , ksi (MPa)	F _u , ksi (MPa)
GB/T 1591	Q355 B	51.49 (355)	68.17 (470)

1. Mechanical properties of GB/T 1591 Grade Q355 B meet or exceed the mechanical properties of ASTM A1011 SS Grade 50.

Corrosion Protection

Hot-Dipped Galvanized (HDG)

MT-B-GXL S2 OC

Ordering Information

Description	Weight Per Piece lbs (kg)	Quantity Piece(s)	Item No.
MT-B-GXL S2 OC	20.72 (9.4)	2	2272107

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
1,070 (4.78)	530 (2.36)	1,070 (4.78)

1. Minimum safety factor, Ω , for tabulated values is 2.65.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. See Figure 32.

Table 122 - Limit State Design (LSD) Load Data^{1,2}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
1,380 (6.15)	645 (2.88)	1,380 (6.15)

1. Maximum resistance factor, Φ , for tabulated values is 0.5.
2. See Figure 32.

Table 123 - Allowable Strength Design (ASD) Load Data^{1,2,3}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
1,025 (4.56)	170 (0.77)	1,025 (4.56)

1. Minimum safety factor, Ω , for tabulated values is 2.65.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. See Figure 33.

Table 124 - Limit State Design (LSD) Load Data^{1,2}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
1,320 (5.88)	210 (0.95)	1,320 (5.88)

1. Maximum resistance factor, Φ , for tabulated values is 0.5.
2. See Figure 33.

3.0 MODULAR SUPPORT SYSTEM

3.2.3 MT SYSTEM CONNECTORS

MT-C-T/2

Description

T-connector for channels.

Material Specifications

Standard ¹	Grade ¹	F _y , ksi (MPa)	F _u , ksi (MPa)
GB/T 700	Q235 B	34.08 (235)	53.66 (370)

1. Mechanical properties of GB/T 700 Grade Q235 B meet or exceed the mechanical properties of ASTM A1011 SS Grade 33.

Corrosion Protection

Electro-Galvanized (EG)

MT-C-T/2

Hot-Dipped Galvanized (HDG)

MT-C-T/2 OC

Ordering Information

Description	Weight Per Piece lbs (kg)	Quantity Piece(s)	Item No.
MT-C-T/2	1.74 (0.79)	15	2272054
MT-C-T/2 OC	1.74 (0.79)	15	2272055

Figure 34 - MT Channel Connection

1. Maximum resistance factor, ϕ , for tabulated values is 0.55.
2. See Figure 63.

Table 185 - Allowable Strength Design (ASD) Load Data^{1,2,3}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
835 (3.72)	80 (0.37)	1,320 (5.88)

1. Minimum safety factor, Ω , for tabulated values is 2.65.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. See Figure 64.

Table 186 - Limit State Design (LSD) Load Data^{1,2}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
1,055 (4.70)	95 (0.44)	1,705 (7.59)

1. Maximum resistance factor, ϕ , for tabulated values is 0.5.
2. See Figure 64.

3.0 MODULAR SUPPORT SYSTEM

3.2.4 MT SPLICE CONNECTORS

MT-ES-70 OC

Description

Splice connector for coupling MT-70 or MT-80 girders end-to-end.

Material Specifications

Standard ¹	Grade ¹	F _y , ksi (MPa)	F _u , ksi (MPa)
GB/T 1591	Q355 B	51.49 (355)	68.17 (470)

1. Mechanical properties of GB/T 1591 Grade Q355 B meet or exceed the mechanical properties of ASTM A1011 SS Grade 50.

Corrosion Protection

Hot-Dipped Galvanized (HDG)

MT-ES-70 OC

Ordering Information

Description	Weight Per Piece lbs (kg)	Quantity Piece(s)	Item No.
MT-ES-70 OC	4.03 (1.83)	4	2272078

Figure 65 - MT Splice Connection

Table 187 - Allowable Strength Design (ASD) Load Data^{1,2,3}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
10,180 (45.30)	1,100 (4.90)	1,795 (8.00)

1. Minimum safety factor, Ω , for tabulated values is 2.05.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. See Figure 65.

Table 188 - Limit State Design (LSD) Load Data^{1,2}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)
13,240 (58.90)	1,435 (6.40)	2,335 (10.40)

1. Maximum resistance factor, ϕ , for tabulated values is 0.75.
2. See Figure 65.

Figure 66 - MT Splice Connection

Table 189 - Allowable Strength Design (ASD) Load Data^{1,2,3}

F _x lb (kN)	F _y lb (kN)	F _z lb (kN)	M _y ft lb (kN m)
20,360 (90.60)	2,200 (9.80)	3,595 (16.00)	3,340 (4.53)

1. Minimum safety factor, Ω , for tabulated values is 2.3.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. See Figure 66.

Table 190 - Limit State Design (LSD) Load Data^{1,2}

18,905 (84.10)	2,255 (10.04)	7,040 (31.32)	2,895 (3.93)

1. Maximum resistance factor, ϕ , for tabulated values is 0.75.
2. See Figure 68.
3. Loading in the negative x-direction is not recommended for this connector.

3.0 MODULAR SUPPORT SYSTEM

3.2.6 MT ANGLE BRACES AND FITTINGS

MT-AB-A

Description

Adjustable brace for anchoring bracing of MT-50 channel.

Material Specifications

Standard ¹	Grade ¹	F _y , ksi (MPa)	F _u , ksi (MPa)
GB/T 700	Q235 B	34.08 (235)	53.66 (370)

1. Mechanical properties of GB/T 700 Grade Q235 B meet or exceed the mechanical properties of ASTM A1011 SS Grade 33.

Corrosion Protection

Electro-Galvanized (EG)

MT-AB-A

Hot-Dipped Galvanized (HDG)

MT-AB-A OC

Ordering Information

Description	Weight Per Piece lbs (kg)	Quantity Piece(s)	Item No.
MT-AB-A	0.97 (0.44)	12	2346395

Table 215 - Allowable Strength Design (ASD) Load Data^{1,5,6,7}

Bracket	Weight lbs (kg)	L in (mm)	W lb/in (N/cm)	F1 lb (kN)
MT-BR-30 300 (OC)²	1.43 (0.65)	11-13/16 (300)	18.62 (33.03)	220 (1.00)
MT-BR-30 450 (OC)²	1.93 (0.88)	17-11/16 (450)	8.20 (14.68)	145 (0.66)
MT-BR-40 300 (OC)²	2.49 (1.13)	11-13/16 (300)	66.04 (116.36)	780 (3.49)
MT-BR-40 450 (OC)²	3.15 (1.43)	17-11/16 (450)	29.35 (51.71)	520 (2.33)
MT-BR-40 600 (OC)²	3.84 (1.74)	23-5/8 (600)	16.51 (29.09)	390 (1.75)
MT-BR-40 1000 (OC)²	5.64 (2.56)	39-3/8 (1000)	5.97 (10.47)	235 (1.05)
MT-BR-40 O4 600 OC	5.69 (2.58)	23-5/8 (600)	18.20 (32.16)	430 (1.93)
MT-BR-40 O4 1000 OC	7.50 (3.40)	39-3/8 (1000)	6.60 (11.58)	260 (1.16)
MT-BR-40D 600 (OC)^{3,4}	3.84 (1.74)	23-5/8 (600)	50.17 (88.12)	1,185 (5.29)
MT-BR-40D 1000 (OC)^{3,4}	5.64 (2.56)	39-3/8 (1000)	18.03 (31.72)	710 (3.17)
MT-BR-40D O4 600 OC	8.40 (3.81)	23-5/8 (600)	50.17 (88.12)	1,185 (5.29)
MT-BR-40D O4 1000 OC	12.02 (5.45)	39-3/8 (1000)	18.03 (31.72)	710 (3.17)
MT-BR-40D O4 1500 OC	16.49 (7.48)	59-1/16 (1500)	8.04 (14.10)	475 (2.11)

1. Minimum safety factor, Ω , for tabulated values is 2.5.
2. No reductions to tabulated loads need to be applied for bracket attachment to channel.
3. For bracket attachment to 14 gauge vertical channel, multiply tabulated load values by 0.61.
4. For bracket attachment to 12 gauge (e.g. MT-50) vertical channel, multiply tabulated load values by 0.66.
5. The loads apply only when channel profile opening is facing upward or downward.
6. The bracket's self-weight has been accounted for in the table load values.
7. Load values are for bracket only. Design professional is responsible for checking base material and fastener strength.

MT-BR-40 O4 600 OC	5.69 (2.58)	23-5/8 (600)	27.52 (48.34)	650 (2.90)
MT-BR-40 O4 1000 OC	7.50 (3.40)	39-3/8 (1000)	9.91 (17.40)	390 (1.74)
MT-BR-40D 600 (OC)^{3,4}	3.84 (1.74)	23-5/8 (600)	75.57 (132.45)	1,785 (7.95)
MT-BR-40D 1000 (OC)^{3,4}	5.64 (2.56)	39-3/8 (1000)	27.18 (47.68)	1,070 (4.77)
MT-BR-40D O4 600 OC	8.40 (3.81)	23-5/8 (600)	75.57 (132.45)	1,785 (7.95)
MT-BR-40D O4 1000 OC	12.02 (5.45)	39-3/8 (1000)	27.18 (47.68)	1,070 (4.77)
MT-BR-40D O4 1500 OC	16.49 (7.48)	59-1/16 (1500)	12.10 (21.19)	715 (3.18)

1. Maximum resistance factor, Ω , for tabulated values is 0.65.
2. No reductions to tabulated loads need to be applied for bracket attachment to channel.
3. For bracket attachment to 14 gauge vertical channel, multiply tabulated load values by 0.52.
4. For bracket attachment to 12 gauge (e.g. MT-50) vertical channel, multiply tabulated load values by 0.57.
5. The loads apply only when channel profile opening is facing upward or downward.
6. The bracket's self-weight has been accounted for in the table load values.
7. Load values are for bracket only. Design professional is responsible for checking base material and fastener strength.

3.0 MODULAR SUPPORT SYSTEM

3.2.8 MT CLAMPS AND CHANNEL TIES

MT-CC-30

Description

Clamp for channel-to-channel or channel-to-girder connections.

Material Specifications

Standard ¹	Grade ¹	F _y , ksi (MPa)	F _u , ksi (MPa)
GB/T 700	Q235 B	34.08 (235)	53.66 (370)

1. Mechanical properties of GB/T 700 Grade Q235 B meet or exceed the mechanical properties of ASTM A1011 SS Grade 33.

Corrosion Protection

Electro-Galvanized (EG)

MT-CC-30

Ordering Information

Description	Weight Per Piece lbs (kg)	Quantity Piece(s)	Item No.
MT-CC-30	0.60 (0.27)	10	2322427

Table 267 - Allowable Strength Design (ASD) Load Data^{1,2,3,4}

F_x lb (kN)	F_z lb (kN)
485 (2.17)	680 (3.03)

1. Minimum safety factor, Ω , for tabulated values is 2.0.
2. Multiply tabulated values by 1.5 to obtain minimum Load and Resistance Factor Design (LRFD) values.
3. Tabulated values are for a single connector. Connectors are to be used in pairs.
4. See Figure 110.

Table 268 - Limit State Design (LSD) Load Data^{1,2,3}

F_x lb (kN)	F_z lb (kN)
730 (3.26)	1,010 (4.50)

1. Maximum resistance factor, ϕ , for tabulated values is 0.75.
2. Tabulated values are for a single connector. Connectors are to be used in pairs.
3. See Figure 110.

3.0 MODULAR SUPPORT SYSTEM

3.2.11 MT MEDIA FIXATION

MT-FPS-GS OC

Description

Adjustable guiding bracket for fastening sliding pipe shoes to MT-70 and MT-80 (short side) girders.

Material Specifications

Standard ¹	Grade ¹	F _y , ksi (MPa)	F _u , ksi (MPa)
GB/T 700	Q235 B	34.08 (235)	53.66 (370)

1. Mechanical properties of GB/T 700 Grade Q235 B meet or exceed the mechanical properties of ASTM A1011 SS Grade 33.

Corrosion Protection

Hot-Dipped Galvanized (HDG)

MT-FPS-GS OC

Ordering Information

Description	Weight Per Piece lbs (kg)	Quantity Piece(s)	Item No.
MT-FPS-GS OC	0.49 (0.22)	12	2273702

5.1 GENERAL INFORMATION FOR LOAD TABLES STANDARD STEEL PIPE INFORMATION

Based on ASME B36.10M-2018 information.

Specific gravity (SG) of 1.0 for contents (water has a density, ρ_w , 62.4 lbs/ft³).

Insulation thickness (t_{ins}) (ρ_{ins}) 9.0 lbs/ft³ [foamglass].

Ice thickness (t_{ice}) 1 inch with a density (r_{ice}) 56 lbs/ft³.

Density of steel, ρ_s , is 490 lbs/ft³.

Support spacing is based on MSS SP-58.

5.1 GENERAL INFORMATION FOR LOAD TABLES

STANDARD PVC PIPE INFORMATION

Based on ASME B36.10M-2018 information.

Specific gravity (SG) of 1.0 for contents (water has a density, ρ_w , 62.4 lbs/ft³).

Temperature of pipe contents is less than 100° F.

Density of PVC, ρ_{pvc} , is 86.15 lbs/ft³.

Support spacing is based on MSS SP-58.

5.1 GENERAL INFORMATION FOR LOAD TABLES

TYPE L / ACR COPPER TUBING

Dimensions taken from ASTM B88-83.

Specific gravity (SG) of 1.0 for contents (water has a density, ρ_w , 62.4 lbs/ft³).

Density of copper, ρ_c , is 559.35 lbs/ft³.

Support spacing is based on MSS SP-58.

5.1 GENERAL INFORMATION FOR LOAD TABLES

GALVANIZED RIGID STEEL CONDUIT

The following tables are for information only.
As per UL Standard Safety 6 manufactured to ANSI C80.1

For Galvanized Rigid Conduit (GRC) Trade Tolerances are for outer diameter:

-/+0.015 inches for 1/2" to 1-1/2"
-/+ 1% for 2" to 6"

Conduit weight is an approximation.

Galvanized Rigid Conduit (GRC)				
Trade Size (in)	Avg Outer Diameter in (mm)	Avg Inner Diameter in (mm)	Avg Wall Thickness t_w in (mm)	Approximate Weight lb/100 ft (kg/m)
1/2	0.84 (21.3)	0.632 (16.05)	0.104 (2.64)	82 (1.22)
3/4	1.05 (26.7)	0.836 (21.23)	0.107 (2.72)	109 (1.62)
1	1.315 (33.4)	1.063 (27.00)	0.126 (3.20)	161 (2.40)
1-1/4	1.66 (42.2)	1.394 (35.41)	0.133 (3.38)	218 (3.24)
1-1/2	1.99 (50.5)	1.624 (41.25)	0.138 (3.51)	263 (3.91)
2	2.375 (60.3)	2.083 (52.91)	0.146 (3.71)	350 (5.21)
2-1/2	2.875 (73.0)	2.489 (63.22)	0.193 (4.90)	559 (8.32)
3	3.5 (88.9)	3.09 (78.49)	0.205 (5.21)	727 (10.82)
3-1/2	4 (101.6)	3.57 (90.68)	0.215 (5.46)	880 (13.10)
4	4.5 (114.3)	4.05 (102.87)	0.225 (5.72)	1030 (15.33)
5	5.563 (141.3)	5.073 (128.85)	0.245 (6.22)	1520 (22.62)
6	6.625 (168.3)	6.093 (154.76)	0.266 (6.76)	1785 (26.56)

Rigid and Intermediate Metal Conduit shall be supported at least every 10 feet (3.05 m) and within 3 feet (914 mm) of each outlet box, junction box, cabinet, or fitting, except for straight runs of conduit connected with couplings which may be supported in accordance with NEC Article 345 and 346, provided such supports prevent transmission of stresses to termination where conduit is deflected between supports.

INTERMEDIATE METAL CONDUIT

The following tables are for information only.

As per UL Standard Safety 6 manufactured to ANSI C80.1
For Intermediate Metal Conduit (IMC) Trade Tolerances are for outer diameter:

-/+0.005 inches for 1/2" to 1"
-/+0.0075 inches for 1-1/4" to 2"
-/+0.10 inches for 2" to 4"

For Intermediate Metal Conduit (IMC) Trade Tolerances for wall thickness:

-/+0.15 inches for 1/2" to 2"
-/+0.20 inches for 2-1/2" to 4"

Conduit weight is an approximation.

Intermediate Metal Conduit (IMC)
